

Grass Weeds

Crabgrasses

Common: Large Crabgrass (Hairy Fingergrass), Smooth Crabgrass (Fingergrass, Smooth Summergrass), Southern Crabgrass (Summergrass)

Scientific: *Digitaria sanguinalis*, *Digitaria ischaemum*, *Digitaria ciliaris*

Affected Crops: Corn, cotton, soybeans, tobacco, and fruits, trees, vegetables.

Identification:

- **Large Crabgrass** - Seedling sheaths and blades are densely hairy. Leaf blades are usually 3-20 cm long and hairy on both surfaces. Seedlings emerge in May and June.
- **Smooth Crabgrass** - Seedling blades and sheaths are smooth. Leaf blades are smaller than large Crabgrass.
- **Southern Crabgrass** - Seedling leaves, sheaths and collars are hairy. Leaf blades are 5-18 cm long, with the upper surface on the upper leaves occasionally being hairy.

Geographical Distribution: Large Crabgrass tends to grow in the lower South. Smooth Crabgrass is widespread throughout the United States. Southern Crabgrass is found mostly on field borders of the South, and up to Connecticut and Nebraska.

Always refer to product labels for specific use instructions.
